# LED UV Curing System

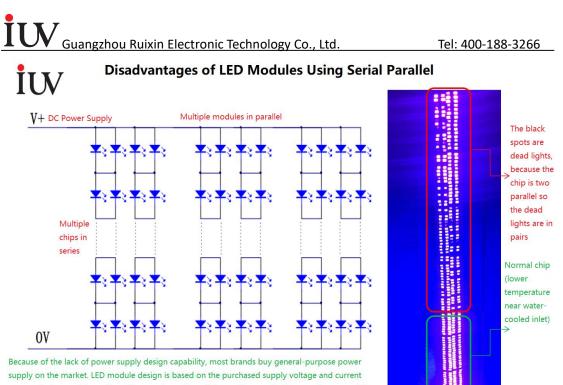

### **1**、Volt-ampere characteristic of LED chip

Conclusion: It can be seen from the volt-ampere characteristics of the LED chip that the simple scheme of using series-parallel and purchasing switching power supply on the market is not the optimal scheme, which can not solve the LED life problem, so it is necessary to independently develop LED special digital power supply for the LED characteristics

Effect of junction temperature on Volt-ampere characteristic of LED I (mA) 800 500 0 3.3.3.4 U(V) LED Feature 3: LED chip is a negative temperature coefficient element, as shown in the figure: the same supply voltage 3.4 V, the chip temperature at 80 degrees and 30 degrees current is 800mA and 500mA, respectively

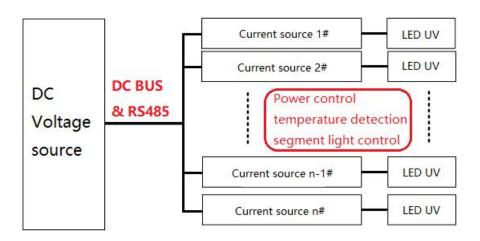

Conclusion: It can be seen from the variation of volt-ampere characteristics of LED chip with temperature and the inconsistency of characteristics caused by LED chip fabrication process that the simple scheme of using series-parallel and purchasing switching power supply on the market can not guarantee the working current consistency of LED chip, so it can not solve the LED life problem.LED chip must be supplied by series mode and constant current source.

reverse design module, so they all use series and parallel operation mode. However, because of the LED volt-ampere characteristics and temperature characteristics (chip consistency and temperature variation), the current distribution in series-parallel mode is inconsistent, high-current chip is first burned down because of high temperature, the burned chip is either short-circuited other chip, or disconnected to increase the current of other bypass chip, the current increase and accelerate

burned chip is either short-circuited other chip, or disconnected to increase the current of other bypass chip, the current increase and accelerate the other chip burning, Therefore, it is necessary to use single-channel series and self-developed constant-current source to guarantee the life of the LED chip.

## **2**、 IUV-LED curing system control scheme

# **3**、Product technical parameters

LED	
Type specification of product	IUV-SuperPlus
Effective width of LED	330~1020mm
Rated power of LED (one unit)	2.5~10KW
Wave length of LED	365nm/385nm/395nm

 Image: Construction of the system
 Tel: 400-188-3266

 ptimum curing distance of LED
 5~8mm

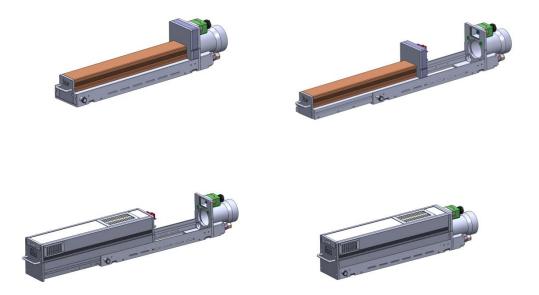

Optimum curing distance of LED	5~8mm
Accuracy of power regulation (LED)	Continuous 1%-100%
Type of cooling (LED)	Water cooling mode, maximum guarantee LED life
Packaging of LED	Aluminum Nitride Ceramic COB(Chips on Board) packaging,
	reduce the thermal resistance, maximum guarantee LED life
LED chip	Korea's latest high-power vertical chip
Ultraviolet energy density(LED)	15~25W/cm2
LED automatic width adjustment function	UV equipment has the function of automatic detection of
	paper width and paper position, LED can achieve many
	levels of automatic control according to the sensor (with the
	material position automatically light up, without the
	material position automatically closed), more effectively
	save energy and reduce the material temperature
Input Power	Three-phase 340~380V 50HZ/60HZ
	800mm*600mm*1250mm(LWH)
Power Supply of LED	Independent research of constant current power supply, to
	ensure that the current of each LED chip is consistent
Power protection	Surge voltage protection short-circuit protection earth
	leakage protection

# Effective width of mercury lamp330~1020mmRated power of mercury lamp (one unit)5~25KWAccuracy of power regulation (mercury lamp)Continuous 15%-100%LED and mercury lamp interchange functionThe system can automatically identify the type of lamp,<br/>automatically switch between power supply and cooling,<br/>can easily cope with the complex process of Flexo printing<br/>curing system requirementsPower protectionSurge voltage protection \ short-circuit protection \ earth<br/>leakage protection

## 4、 Hybrid mercury lamps and LED interchange

With the development of ultraviolet light emitting diode (LED-UV) semiconductor technology and the enhancement of energy saving and environmental protection consciousness, mercury lamp will be replaced by LED technology. LED curing has obvious technical advantages, but it needs ink support to play LED best curing and energy saving effect. during the period of alternating old and new technologies, mercury lamps still retain a certain vitality, and mercury lamps in some special printing processes are still irreplaceable. LED-UV and conventional mercury lamps exist simultaneously in the same curing system for the purpose of saving energy and environmental protection and ensuring the printing process. To solve this problem IUV a simple switching function of mercury lamp and LED is designed. With the same light box base, the same power supply, the same air cooling and water cooling device, the system software will automatically identify the LED-UV or mercury lamp and automatically switch the mode of power supply and cooling if the LED and mercury lamp box core are switched.
